Approximate coverage (in sq. ft.) of one square, when shakes are applied with an average $1 / 2$ " spacing, at following weather exposures, in inches (d):

| Use supplementary with shakes applied not over 10 " weather exposure. |  |  |  |  |

(a) 5 bundles will cover 100 sq . ft , roof area when used as starter-finish course at 10 " weather exposure; 7 bundles will cover 100 sq . ft. roof area at $71 / 2^{\prime \prime}$ weather exposure; see footnote (d)
(b) Maximum recommended weather exposure for 3-ply roof construction.
(c) Maximum recommended weather exposure for 2-ply roof construction.
(d) All coverage based on an average $1 / 2^{\prime \prime}$ spacing between shakes.
(e) Maximum recommended weather exposure.
*100 sq. ft. coverage is based on $12 / 12$ pack, 5 bundle square, at $71 / 2$ " exposure.
(f) Note: While most shakes are packed in bundles of 12 courses each side $(12 / 12)$ they may be packed $9 / 9$. This will alter the number of bundles required to cover 1 square.
For example: 18 " shake bundles $12 / 12$ should cover 100 square feet at $71 / 2^{\prime \prime} \operatorname{exposure}$. $9 / 9$ pack should give $75 \%$ coverage of a square. Check with your supplier to confirm specific packaging (bundle size) used for your order.

## Shake Exposure Table 4

|  | Maximum exposure recommended for roofs |  |
| :--- | :---: | :--- |
| SLOPE | LENGTH |  |
| $4: 12$ and steeper | 71 " $^{\prime \prime}$ | $22^{\prime \prime}$ |

(a) 24 " $\times 3 / 8$ " handsplit shakes limited to $71 / 2^{\prime \prime}$ maximum weather exposure per UBC and IBC.

Formula for calculating material at reduced exposures: Square footage divided by reduced coverage = total material required e.g. you are estimating a roof that measures 3200 square feet ( 32 squares). You have decided to put 16" Certigrade shingles (No. 1 Blue Label or No. 2 Red Label) at 4" exposure.
The above coverage table (Table 1) tells you that a 4-bundle square at 4" exposure covers 80 square feet. 3200 divided by $80=40$ squares of material
